

ApexCeloGrid

An open, public record of the electricity Nigeria produces — free for everyone.

This page explains ApexCeloGrid in plain words. No technical background needed.

What is it?

ApexCeloGrid is like a **public receipt book for electricity**. Every time a solar mini-grid or any power system in Nigeria produces electricity, it can write a simple receipt: *this place produced this much power, on this day*.

These receipts are kept in one shared, open record that **anyone in the world can look at, for free** — and that no single person can secretly change or erase.

In one sentence: ApexCeloGrid is a free, open, and trustworthy record of who is generating electricity in Nigeria, where, and how much.

Why does it matter?

Today, when a community power plant says how much electricity it made, you often just have to take its word for it. There is no easy way for a bank, a government office, or an ordinary citizen to check.

That missing trust slows everything down — payments to power operators, clean-energy funding, and simply **knowing whether communities are really getting the power they were promised**.

ApexCeloGrid gives everyone **the same honest numbers** to look at. Trust becomes automatic.

How it works — in three steps

1

A grid produces power

A solar mini-grid (or any generator) measures the electricity it made.

2

It writes a receipt

A small free tool records the amount into the public ledger.

3

Everyone can see it

Anyone can read and check the record online — no login, no fee.

Our three promises

Free

Free to read. Free to take part.
No one is ever charged.

Simple

Works with the equipment operators already have. Easy to join.

Open

The code is public. Anyone can use it, copy it, or build on it.

Where is the record kept?

On a **public blockchain called Celo** — a shared digital ledger run by thousands of computers around the world. Because it is public and shared, the record stays online and open on its own. We do not need to own a big server, and no company controls it.

Wait — is it really free? Reading is free forever. Writing a record costs a tiny fraction of one naira, so small it is practically nothing. Ordinary people and communities never pay anything.

Who is this for?

Everyone: **power operators** who want their good work recorded, **banks and funders** who need to trust the numbers, **government** wanting a clear national picture, and **citizens** who simply want to know the truth about power in their community.

ApexCeloGrid is a gift to the country. It is open-source, free, and built so that **whoever uses it does so to help the people of Nigeria.**

This is an explainer, not a legal or financial document. ApexCeloGrid is an independent open-source project.
